Triplooper – Feature Overview

Area	What the user sees	Core code
Public landing / browsing	Home, property cards, pricing page	LandingPage.tsx, Home.tsx, PricingPag
Guest sign■up & login	Email/password, magic■link	Signup.tsx, Login.tsx, AuthContext.sign
Booking flow	Calendar, room picker, price breakdown, payment	Booking.tsx, RoomDetail.tsx, booking.ts
Document upload	Upload Aadhaar / address proof after booking	guest/UploadDocs.tsx (Supabase stora
Admin / CRM	Dashboard, staff, POS, reports, website editor	pages/crm/*.tsx
Property sub■domain	example.triplooper.com	generateSubdomain() + create_tenant

Auth & Session (AuthContext)

Function	Purpose
login(email, password)	Clerk first, Supabase fallback
signup(email, password, businessName, businessType)	Create Clerk user then business + tenant, generate sub■don
verifyEmail(code, …)	Complete Clerk flow, loadProperties
logout()	Clear Clerk / Supabase session
addProperty(name, type)	Owners can create additional properties, auto sub■domain
switchProperty(tenantId)	Swap active property, persist in localStorage
hasPermission(allowedRoles)	Role guard, always true for platform admin
loginAsDemo()	Load demo tenant (Ocean View Demo Resort)

WhatsApp Confirmation (whatsapp.ts)

The function sendWhatsAppConfirmation pulls tenant config, builds a message (fallback template if none), creates a guest■portal URL (tokenized or generic), and invokes the Supabase Edge Function 'send-whatsapp' which talks to Twilio/WhatsApp. It returns success/failure info.

Evolutions API sync

After a reservation is saved, Booking.tsx calls supabase.functions.invoke("sync-evolutions") with tenant_id, reservation_id, dates, and status. The edge function POSTs to https://api.evolutions.io/v1/sync so the housekeeping system knows about upcoming stays.

Document Upload (guest portal)

Guest opens a magic■link (email or WhatsApp). The token is validated against guest_tokens. Upload component uses supabase.storage.from("guest-docs") to store files, saving URLs in guest_documents linked to the reservation.
